AeroSense: Phase 7 Documentation

Phase Title: Integration & External Access

Objective: To integrate AeroSense with external IoT devices, APIs, and third-party applications for seamless data exchange, live updates, and external access.

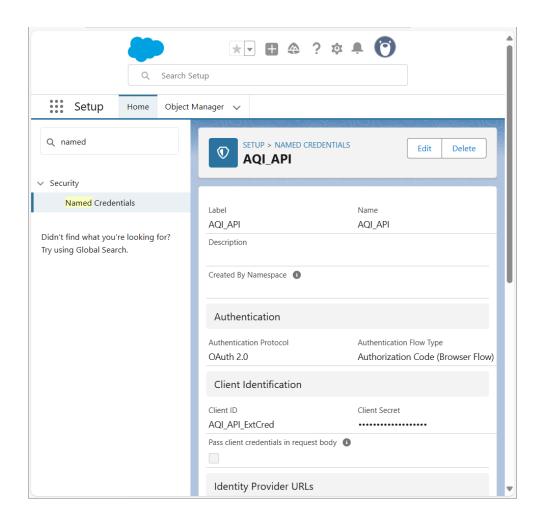

1. Named Credentials

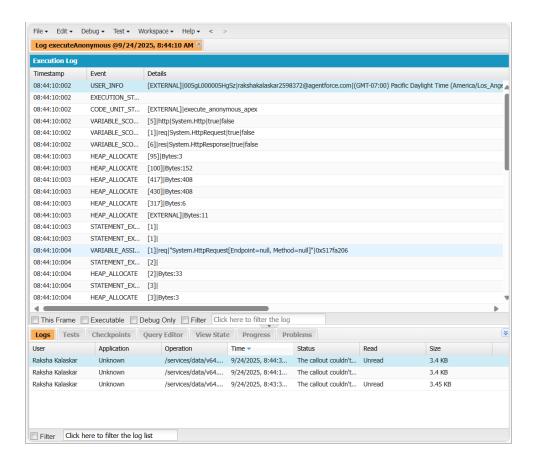

- Path: Setup → Named Credentials → External Auth Identity Providers → New
- Create a secure credential for external APIs (e.g., Government AQI API).
- Example:
 - o Label: AQI API
 - URL: https://api.openaq.org/v1/
 - o Authentication: OAuth 2.0 (if required).
 - Client ID: AQI_API_ExtCred
 - Test Named Credential: Open Developer Console → Execute Anonymous.

```
HttpRequest req = new HttpRequest();
req.setEndpoint('callout:AQI_API/latest?city=Delhi');
req.setMethod('GET');

Http http = new Http();
HttpResponse res = http.send(req);

System.debug(res.getBody());
```

2. External Services (Schema Import)

- Use External Services Wizard to connect to REST APIs via Swagger/OpenAPI schema.
- Example: Import **Air Quality Index API schema** → Auto-generate Apex Actions.
- Benefit: No need to write manual callouts for simple integrations.

3. REST API Callouts (Apex)

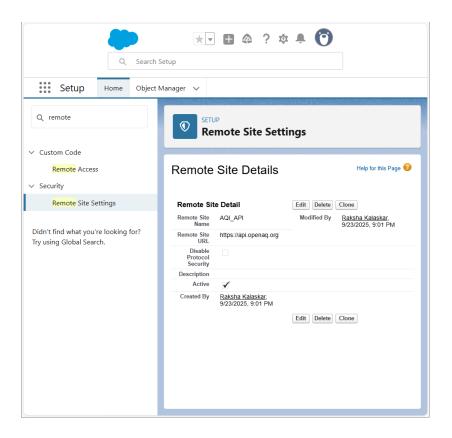

Whitelist the API Domain:

New Remote Site.

Remote Site Name: AQI API

Remote Site URL: https://api.openaq.org/v2

Save.

Create the Apex Class:-

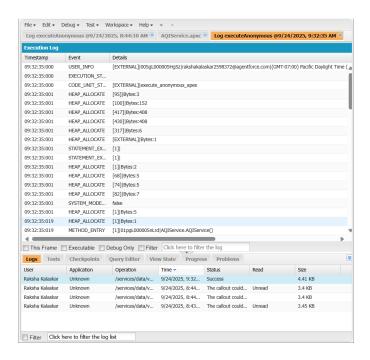

In Developer Console or VS Code, create a new Apex class.

```
public with sharing class AQIService {
  @AuraEnabled
  public static String getExternalAQI(String city) {
    try {
      Http http = new Http();
      HttpRequest req = new HttpRequest();
      req.setEndpoint('https://api.openaq.org/v2/cities?country=' + city);
      req.setMethod('GET');
      req.setTimeout(2000);
      HttpResponse res = http.send(req);
      if (res.getStatusCode() == 200) {
        return res.getBody(); // raw JSON response
        return 'Error: ' + res.getStatusCode() + ' - ' + res.getStatus();
    } catch (Exception e) {
      return 'Exception: ' + e.getMessage();
                                               }}}
```

\circ Test in Anonymous Window Developer Console \to Debug \to Open Execute Anonymous Window.

Run:

System.debug(AQIService.getExternalAQI('IN')); // IN = India

4. SOAP API (Optional)

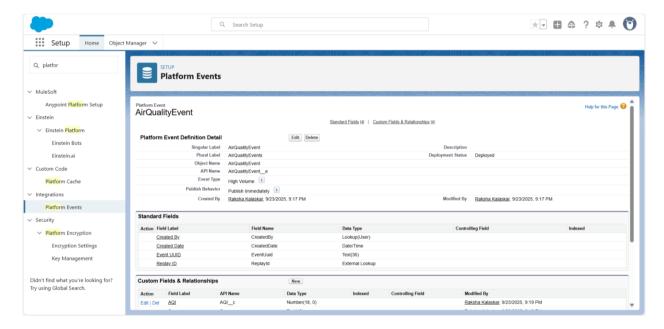

If external calibration systems only provide SOAP:

- Create WSDL2Apex class by importing WSDL.
- Use generated Apex class to call calibration services.

5. Platform Events

Used for real-time communication.

- Object: AirQualityEvent e
 - o Fields: Sensor__c, AQI__c, Severity__c, Timestamp__c

• Publishing Event (Apex):

```
AirQualityEvent__e eventMsg = new AirQualityEvent__e(

Sensor__c = 'S1',

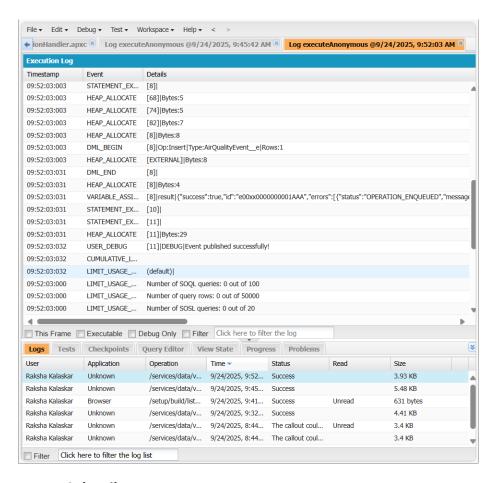

AQI__c = 210,

Severity__c = 'High',

Timestamp__c = Datetime.now()

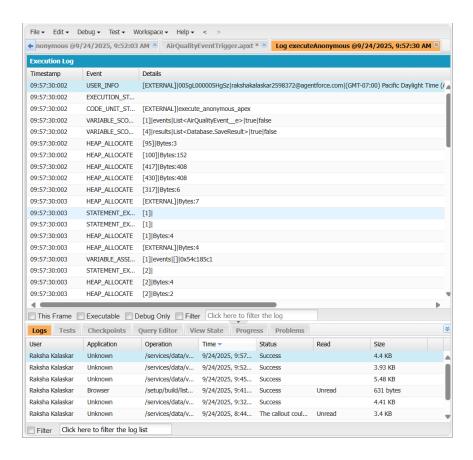

);

Database.SaveResult result = EventBus.publish(eventMsg);
```

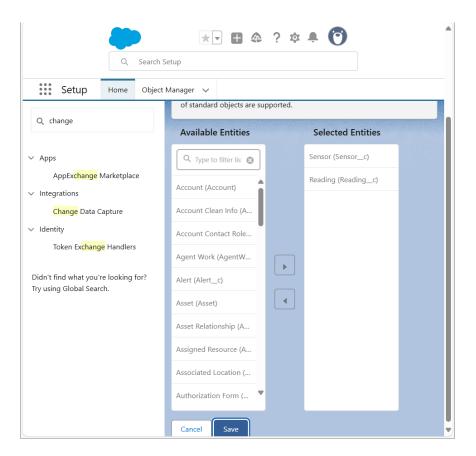

• Subscribers:

- External IoT system (via CometD).
- Another Salesforce org.
- o Slack/MS Teams integration (via middleware).

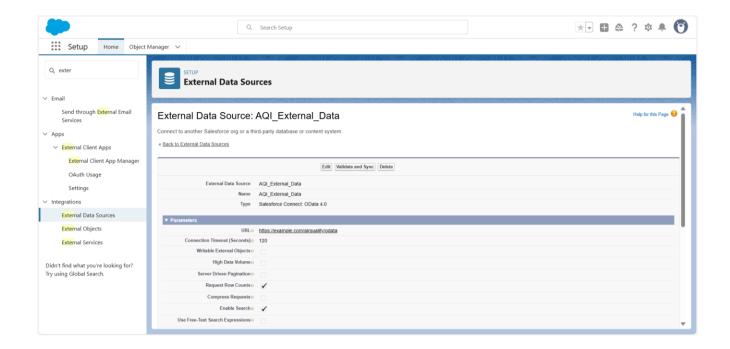

6. Change Data Capture (CDC)

- Enable CDC on Sensor_c and Reading_c objects.
- Use case: External dashboard auto-updates when new readings are inserted.

7. Salesforce Connect

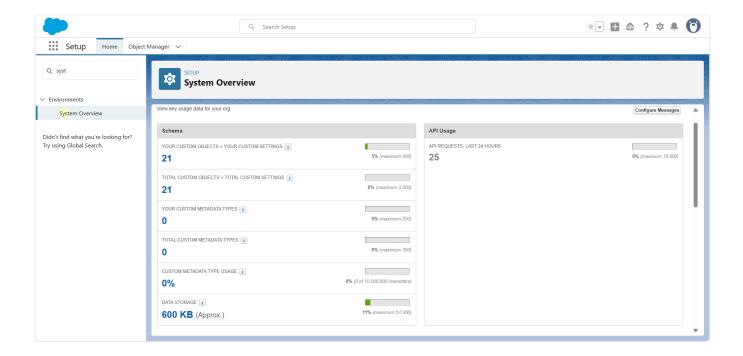

- Use **OData adapter** to integrate with large external AQI datasets without storing them inside Salesforce.
- Example: Connect to external Air Quality Open Data → show live reference data inside Salesforce tabs.

8. API Limits & Best Practices

- Salesforce daily API calls = 100,000 (Dev org = 15,000).
- Always use Named Credentials for security.
- Cache responses with @AuraEnabled(cacheable=true) for performance.
- Apex using Named Credential

```
public with sharing class ExternalClient {
    public static String fetchData() {
        HttpRequest req = new HttpRequest();
        req.setEndpoint('callout:My_Named_Cred/path/to/resource');
        req.setMethod('GET');
        HttpResponse res = new Http().send(req);
        return res.getBody();
    }
}
```

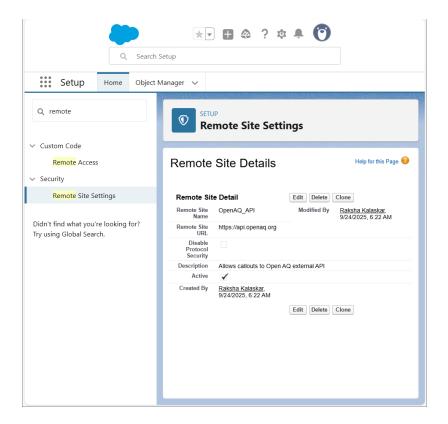

9. OAuth & Authentication

- Enable **OAuth** for third-party mobile apps accessing AeroSense.
- Example: A mobile app authenticates via OAuth and fetches alerts for nearby AQI sensors.

10. Remote Site Settings

- Before making callouts, add API domains under:
 - Setup → Remote Site Settings → New
 - o Example: https://api.openaq.org

11. Example Use Case in Action

- 1. **IoT Sensor** pushes air quality data to external server.
- 2. Salesforce (via REST API callout) fetches new data every hour.
- 3. Platform Event broadcasts "Critical AQI Detected" to Slack.
- 4. CDC updates dashboards in near real time.
- 5. Executives see external AQI comparison (local vs government API) directly in Salesforce.
